

# MedQuest: Questline Platform for Mental Health and Confidence

## Overview:

MedQuest turns personal growth into a structured RPG-style questline. Users progress through Acts (Tutorial → Discomfort Zone → Skill Tree → Boss Fight), completing real-world "quests" that build confidence through small, trackable wins rather than passive self-help content.

## Features

### Core

- **Questline Engine:** Pre-built questlines (e.g. "Foundations") organized into Acts and Quests, each targeting a specific psychological mechanic (exposure, small wins, reflection, closure).
- **XP and Leveling:** Progress tracked by completions, not mood. Users level up only when quests are logged, keeping the system evidence-based rather than feelings-based.
- **Daily Log:** A lightweight 3-line nightly journal (what I did / what went okay / what I'd change) with no self-judgment prompts.
- **No-Skip Gating:** Later Acts (e.g. Boss Fight) stay locked until earlier reps are logged, preventing users from jumping to high-stakes challenges unprepared.
- **Streak and Retry Tracking:** Tracks attempts, not just successes (e.g. "No Streak" for rejection tolerance), reframing setbacks as data.

### Supporting

- **Custom Questline Builder:** Users or communities (schools, clubs, therapists) can author their own Acts/Quests for specific goals.
- **Weekly Retro Prompt:** A 10-minute structured review nudging users to reflect and decide if they're ready to advance.
- **Privacy-First Journaling:** Logs are private by default; sharing is opt-in.
- **Community Quest Board** (optional): Peer-shared quests and anonymized completion stats for social proof without direct comparison/pressure.
- **Educator/Counselor Dashboard** (optional): Aggregated, anonymized progress view for facilitators running the hub in a class or support group setting.

## SWOT Analysis

|                      |                                                                                                                                                                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Strengths</b>     | Grounded in real behavioral mechanics (graded exposure, reflection, small-wins theory) rather than generic affirmations; gamification increases engagement and follow-through; flexible/customizable for different contexts (students, therapy adjuncts, workplaces)                     |
| <b>Weaknesses</b>    | Not a substitute for clinical mental health support<br>Risk of misuse if positioned as therapy<br>Requires sustained user motivation to log consistent<br>Content quality depends heavily on questline design (poorly designed quests could reinforce avoidance instead of resolving it) |
| <b>Opportunities</b> | Growing demand for accessible, low-cost mental health tools among students/young adults; partnerships with universities, counseling centers, or wellness programs; expansion into custom questlines for specific goals (public speaking, social anxiety, career confidence)              |
| <b>Threats</b>       | Crowded wellness-app market with low retention norms; liability/ethical concerns if users in crisis rely on it instead of seeking help; requires clear disclaimers and crisis-resource integration; data sensitivity around mental health logs raises privacy/regulatory scrutiny        |

---

## Four Sustainability Pillars

### People

Builds genuine psychosocial capacity, confidence, resilience, and self-efficacy through repeatable, low-barrier actions. Designed to be inclusive (customizable difficulty, no cost to basic use) so it doesn't just serve people who are already confident enough to seek help.

### Planet

Fully digital delivery avoids physical material waste. Quests can be designed to double as environmental-engagement actions (e.g. "Solo Mission" as a walk/clean-up, community quests tied to local sustainability initiatives), linking personal growth with environmental stewardship.

### Prosperity

Low-cost/free core access removes financial barriers to mental health support. Long-term, confident, resilient individuals are more likely to pursue education, employment, and entrepreneurship creating downstream economic value. Potential sustainable revenue via institutional licensing (universities, employers) rather than gatekeeping individual access.

### Education

The Skill Tree Act directly ties confidence-building to competence-building (teaching others, sharing work publicly), reinforcing learning outcomes. The platform itself can be embedded in educational settings, orientation programs, student wellness curricula, or peer-mentoring schemes turning soft-skill development into a structured, trackable part of learning.
