

PersonalityQuest User Testing Summary

Sign up

- The sign-up screen is clear
- Blank fields and invalid account details are highlighted with helpful validation messages.
- Password confirmation is checked before the account is created
- After signing up, the user is taken directly to the archetype quiz, which creates a clear starting point.
- The number of fields may feel slightly high for a first screen, especially before the user understands the purpose of the application.

Sign in

- The sign-in process is simple and easy to understand.
- Incorrect or incomplete details provide feedback to the user.
- There does not appear to be a visible “Forgot password” option, which could make account recovery difficult.

Complete the quiz

- The quiz is straightforward and shows the user’s progress.
- Users must select an answer before continuing, which prevents incomplete results.
- The Back button allows users to review previous answers.

View archetype and quest

- The archetype page presents the user’s result, strengths, weaknesses, description, and quest focus.
- The page includes a ranked list of other archetypes, which adds useful context.
- The “Redo” option is easy to understand.
- The quest information gives the application a clear purpose
- Some of the descriptive content may be lengthy and could be easier to scan if it were separated into shorter sections

View weekly tasks

- Weekly tasks and quest tasks are not separated clearly.
- Selecting a task displays its description, status, reflection area, and available actions.
- Completed tasks are visually identified.
- The task descriptions may still feel broad, and users unsure what a successful completion looks like

Complete a weekly task

- Users can write a reflection and either request AI feedback, save a draft, or submit the task.
- The system prevents users from submitting an empty reflection.
- The AI feedback depends on the service being available, so the experience may be inconsistent if the connection fails.

Save a draft

- The Save Draft option is easy to find.
- Drafts are stored and can be reopened later.
- The user receives feedback confirming that the draft was saved.
- It would be useful to show the last saved time or a clearer saved-state indicator so users know whether their latest changes were stored.

View achievements

- The achievement badges provide a motivating visual reward system.
- The achievement summary shows how many badges have been unlocked.
- Locked achievements do not clearly explain how they can be earned unless the user discovers the additional information.
- This may make the achievement system feel unclear to new users.

Log out

- The log-out option is easy to find in the navigation bar.
- Logging out returns the user to the sign-in screen.
- The process is simple and straightforward.

Suggested improvements

- Add a short explanation of the application's purpose on the sign-up screen
- Add a "Forgot password" option to the sign-in page
- Consider adding more quiz questions or explaining that the result is an introductory archetype
- Rewrite weekly task descriptions using clearer goals, examples, and completion criteria
- Show when a draft was last saved
- Provide a short explanation for each locked achievement, such as "Complete your first weekly task."
- Make the selected language and theme apply across the application and persist after restarting
- Add clearer navigation links to account details and password management.
- Change password fields to hidden-password inputs
- Add a confirmation message before permanently submitting a reflection
- Provide a friendly fallback message when AI feedback cannot be generated
